Fig. 4 a. Vertical section of the same, enlarged eighteen times, showing the large mural pores and the tabulæ.

III.—Description of a new *Species* of *Mus* from Southern India. By OLDFIELD THOMAS, F.Z.S., British Museum.

THE specimen here described was obtained at Kadapa, Madras, by Colonel R. H. Beddome; and has been presented to the British Museum, together with a large series of other Indian Muridæ, by Mr. W. T. Blanford, after whom I propose to name it

Mus Blanfordi, sp. n.

Fur above slate-colour, tipped with fawn; hairs rather long and soft. Belly white, sharply defined. Tail longer than head and body; basal half dark, distal half above and below white; distal third covered with soft, white, shining hairs about a quarter of an inch long, forming a pencil at the tip. Tarsus rather long. Five front and six hind foot-pads. Ears long, oval, nearly naked. Mammæ six, one pectoral and two inguinal pairs.

The skull differs from those of all other Indian rats by the front edge of the external wall of the infraorbital foramen being strongly slanting instead of perpendicular. The interparietal also is much more elongated transversely than usual.

Measurements of the type, an adult female:—Head and body (about) 4·1 inches; tail 6·1; hind foot, without claws, 1·2; forearm and hand 1·3; ear-conch, length from external base ·70, breadth ·54; skull 1·42.
